ASSIGNMENT 2
SOFTWARE MAINTENANCE AND TROUBLESHOOTING

Student: Tauman Saida | Group: ПО-1/24

1. Objective

The objective of this assignment is to examine installed applications, check update status, review settings, investigate common software problems, and document maintenance activities.

2. Software Maintenance Table

The first two application versions and the Task Manager values below are based on the screenshots provided. Complete the third application row using an application installed on your computer.

Application	Current version	Update status	Settings to improve	Recommended action
Visual Studio Code	1.114.1 (User Setup)	Check in the app	Auto Save; update settings	Enable Auto Save if useful; check for updates
Google Chrome	150.0.7870.1 (64-bit, as shown)	Latest version installed (shown)	Privacy; startup pages	Review privacy settings and startup pages
Third installed app: _____	Check About / Settings	Check in the app	Identify two settings	Update or adjust settings if needed

3. Evidence: Visual Studio Code Version

The screenshot shows Visual Studio Code version 1.114.1 (User Setup).

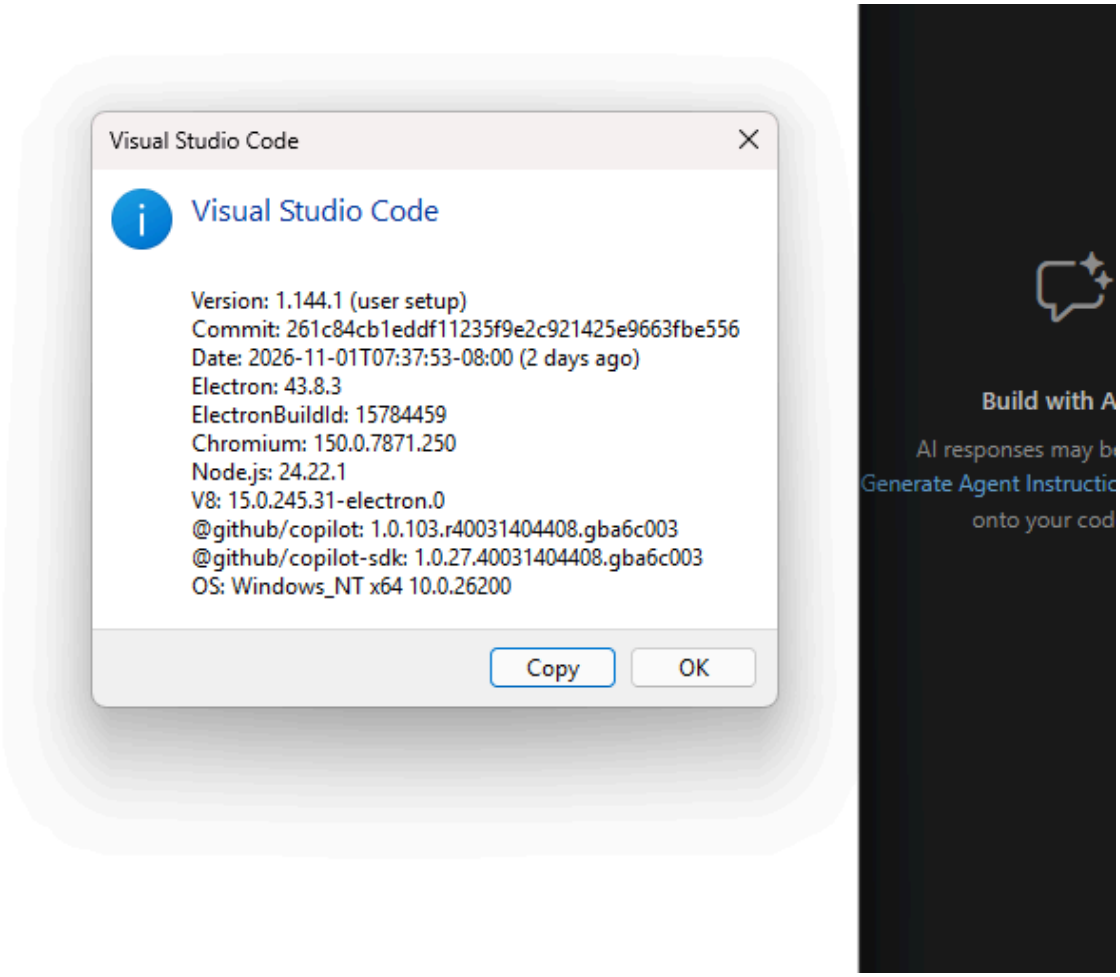

Figure 1. Visual Studio Code About window captured from the student's computer.

4. Evidence: Google Chrome Update Status

The screenshot indicates that the latest version of Google Chrome is installed.

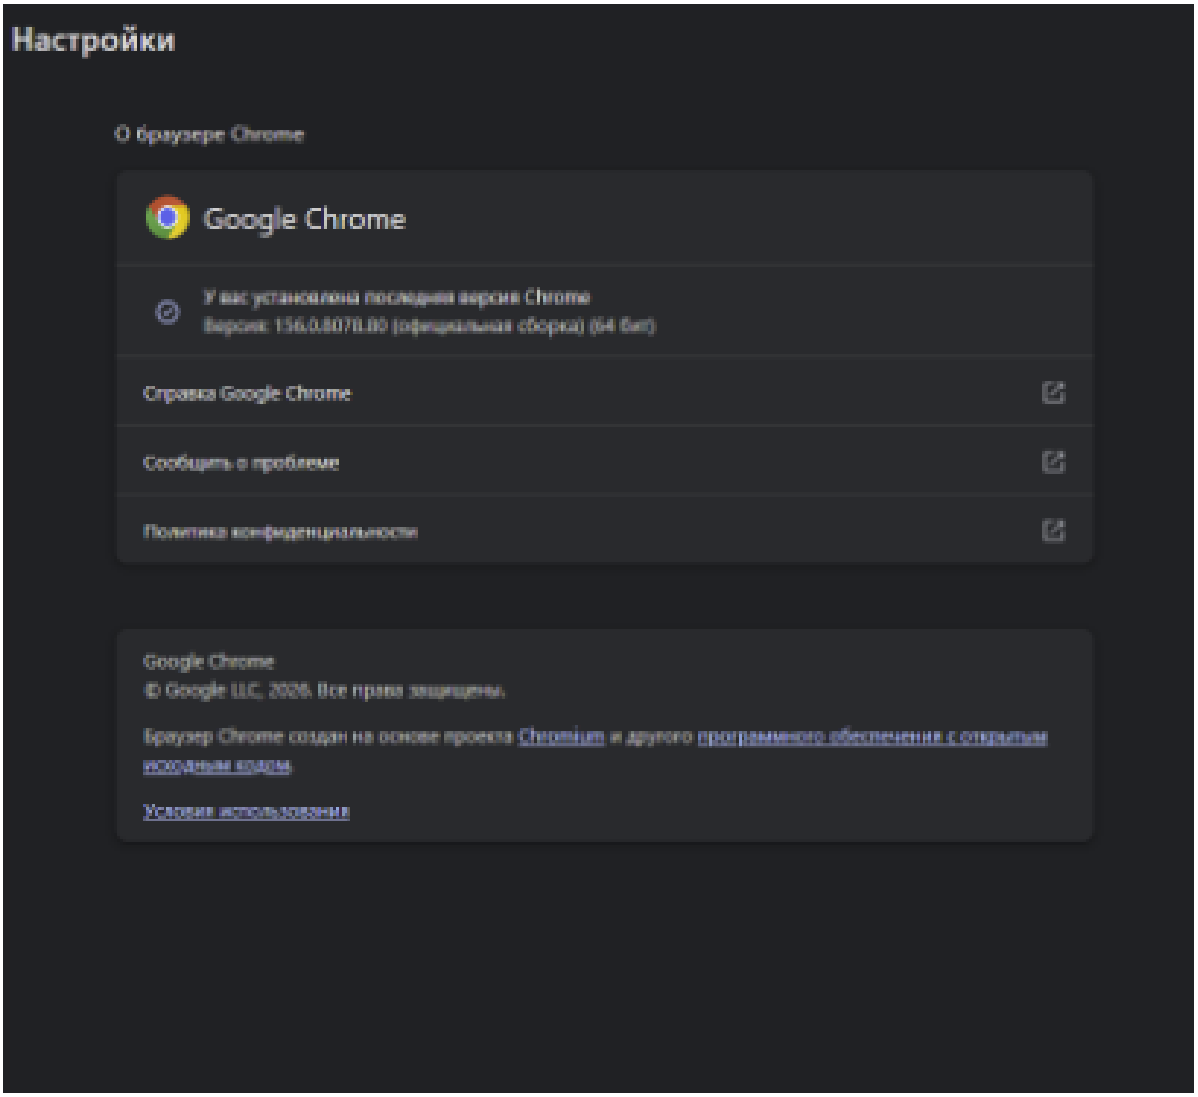

Figure 2. Google Chrome About page captured from the student's computer.

5. Troubleshooting Case 1 — Application Runs Slowly

Possible causes:

- Too many applications are running in the background.
- Available memory or disk space may be limited.
- The application may need an update or have a configuration problem.

Proposed solution: Open Task Manager with Ctrl + Shift + Esc. Review CPU, Memory, and Disk usage. Close unnecessary applications, check available disk space, check for updates, and test the application again.

Observed values at the time of capture: CPU 2%, Memory 31%, Disk 1%, Network 0%. These values are only a snapshot and do not by themselves prove that an application is slow.

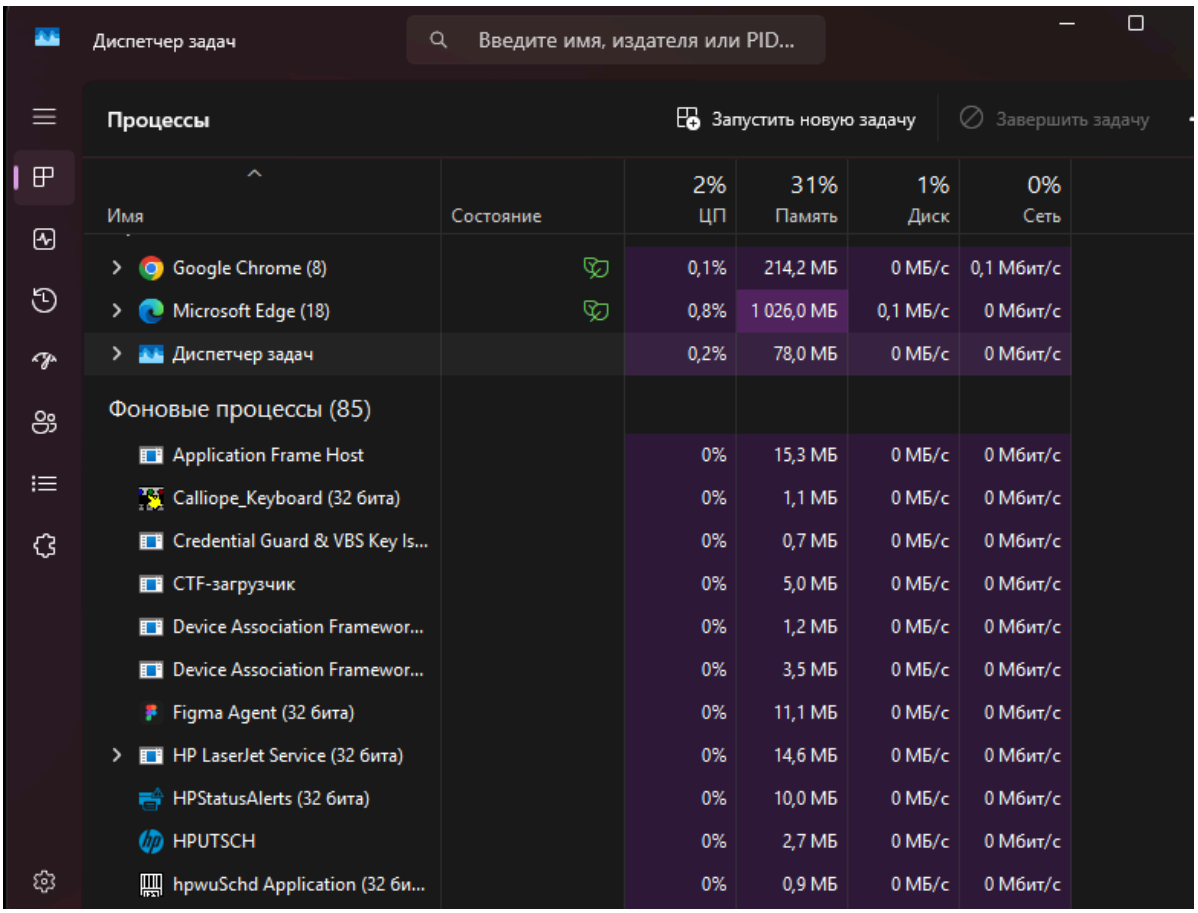

Figure 3. Task Manager Processes tab captured from the student's computer.

Test result: Task Manager opened successfully and displayed current resource usage. If an application still runs slowly, repeat the check while the problem is happening.

6. Troubleshooting Case 2 — Update Failure

Possible causes:

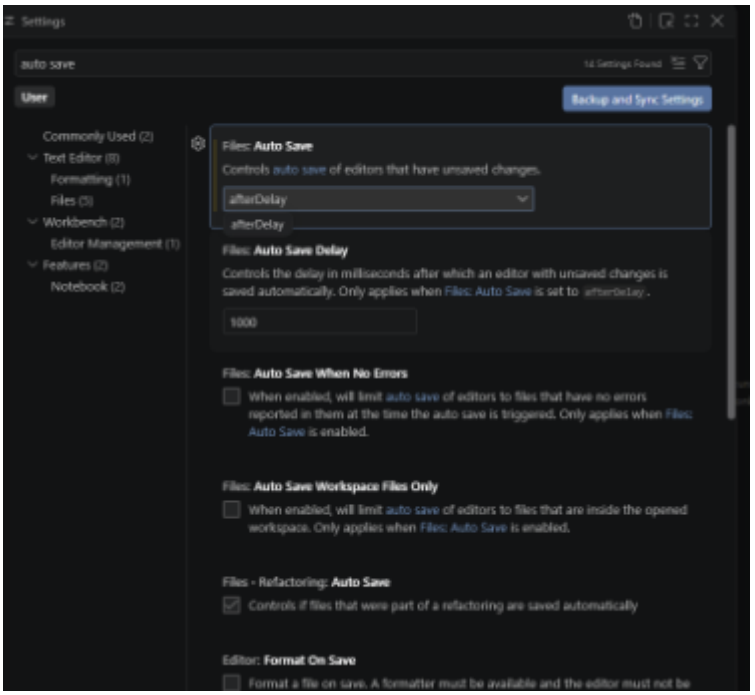

- The internet connection is unstable.
- There is insufficient disk space.
- The update service or installation files have a problem.

Proposed solution: Check the internet connection and available disk space, restart the application, read any error message, and consult official documentation. Download updates only from official sources.

Test result: The provided Chrome screenshot reports that the latest version is installed, so no Chrome update failure is shown in the evidence. Do not claim an update error occurred unless you actually observe one.

7. Application Settings Backup

Selected application: Visual Studio Code. VS Code supports Settings Sync. Open the Accounts menu and look for Settings Sync or Turn on Settings Sync. Follow the on-screen instructions and verify its status. Settings Sync synchronizes settings; it is not necessarily a standalone local backup file. Add a screenshot only if you complete this step.

8. Questions and Answers

1. Why are software updates important? Software updates fix bugs, improve performance, add features, and address security vulnerabilities.

2. Why should important data be backed up before major changes? A backup protects important files and settings from accidental loss and helps restore them if something goes wrong.

3. Why is it important to test an application after troubleshooting? Testing confirms whether the proposed solution worked and checks that the application functions correctly.

4. Why should software be removed using a standard uninstallation method? Standard uninstallation removes application files more safely and reduces the risk of damaging shared components or other applications.

9. Conclusion

In this assignment, I learned how to check application versions, review update status, and use Task Manager to inspect system resource usage. I also learned that troubleshooting should be systematic and that results must be tested and documented. Regular software maintenance helps keep applications reliable and secure.

Before submission: complete the third application row and, if possible, add evidence of the VS Code Settings Sync status.
